

NEW: NON-AMBULATORY ROLLER SYSTEM

NON-AM ROLLER CART SYSTEM

Our supplier of Non-Ambulatory Roller Systems stopped producing the product we have been supplying for many years. Unfortunately this may have caused some delays in completing some orders and we apologize for the inconvenience.

We're happy to announce that a new Roller System will be available within a week or so and they are now being manufactured at our facility in PA.

There will be a few changes and improvements over the previous system.

Changes and features of the new System:

1. The 12' system is now a 15' system and consists of three 5' sections rather than two 6' sections.
2. The 18' system is now a 20' system and consists of four 5' sections rather than three 6' sections.
3. The pool size will remain the same, however, the new roller tables will extend about a foot on either end past the Roll-Up Pool. This will offer more stability and room when positioning or removing patients.
4. The system will be lighter considering the all aluminum rollers and construction.
5. Since most teams decon their patients on a backboard, we are now spacing the rollers at 3" on center, reducing weight and cost.
6. The Systems will be available with an "extra rollers option" for traditional, closer spacing.
7. The System will be available in a "cart" configuration or with the traditional fold-out legs. The cart mounted System will offer storage for the non-ambulatory Roll-Up Pool underneath the roller table. The additional Table will neatly stack on top.
8. Due to the light weight of the system the Cart could be stored "on end" for reduced storage space.
9. Straps will be included to secure all the parts during transportation and storage.
